JSST koronavirusning yangi shtammlari paydo bo‘lishi sababini ma’lum qildi

Jahon sog‘liqni saqlash tashkiloti olimlari koronavirusning yangi shtammlari paydo bo‘lishiga emlashning past ko‘rsatkichlari sabab bo‘lishi mumkinligini ma’lum qilmoqda. Ularning ta’kidlashicha, COVID-19 ning barcha variantlari bemorni kasalxonaga yotqizish va hatto o‘limga olib kelishi mumkin [5].

“Alpha, Beta, Delta, Gamma va Omicron shtammlari emlashning past ko‘rsatkichlari sababli virus variantlari paydo bo‘lishi uchun ideal sharoit yaratganini aks ettiradi”, deyiladi hisobotda [6].

Shuningdek, JSST rasmiylarining ta’kidlashicha, o‘tgan hafta pandemiya davomida eng ko‘p COVID-19 holatlari qayd etilgan.

Aniq bilamizki, bu aniq holatning real bahosi emas, chunki ma’lum qilingan raqamlar ta’til kunlaridagi testlarning orqada qolganligini, ijobiy sinovlari soni va butun dunyo bo‘ylab barcha holatlarni qarab olmagan epidemiologik vaziyat tig‘izligini aks ettirmadi”, ta’kidladi JSST vakili [7].

“Omicron” koronavirus variantining umumiy belgilarini aniqlandi

London Qirollik kolleji professori, shifokor Kler Stiv, ZOE COVID Study eksperti (Buyuk Britaniya hukumati Sog‘liqni saqlash va aholiga xizmat ko‘rsatish departamenti tomonidan qo‘llab-quvvatlangan COVID-19 simptomatik holatlarini to‘plash va tahlil qilish loyihasi) rivojlanayotgan yangi Omicron koronavirus shtammi belgilarining vaziyati haqida fikr bildirdi [8].

“Variantda klassik alomatlар kamroq uchraydi. Hidni yo‘qotish kabi simptomlar keskin tushib ketdi. Muhim alomatlardan biri tomoq og‘rig‘idir, dedi professor Stiv. ZOE ilovasida keltirilgan ma’lumotlarga asoslanib, u tomoq og‘rig‘i barcha holatlarning 57 foizida yuzaga kelayotganini ta’kidladi. Boshqa umumiy simptomlar orasida bosh og‘rig‘i (65%); charchoq (65%), burun oqishi (65%), aksirish (55%)ni tashkil qilmoqda.

Mutaxassisning qo‘srimcha qilishicha, Omikron kasallikning yengilroq shaklini keltirib chiqaradi degan taxmindamiz. Uning xususiyatlarini o‘rganish hali ham davom etmoqda, ammo dastlabki ma’lumotlar virusning ushbu varianti o‘pkada “Delta” shtammi va uning avvalgi shtammlari kabi halokatli ta’sir ko‘rsatmasligini tasdiqlaydi [9].

Ammo mazkur ma’lumotlar xech qanday xotirjamlikni bermaydi. Variantning yuqumliligi kuchayishi infeksiyaning ko‘plab holatlarini keltirib chiqaradi, bu esa kasalxonalarda bemorlarning soni ortishiga olib kelishi mumkin, dedi Kler Stiv.

Doktor Stiv, shuningdek, hukumatni koronavirus infeksiyasi belgilarining rasmiy ro‘yxatini yangilashga chaqirdi. Olim “Omicron” shtammi bilan bog‘liq infeksiyaning uchta massiv alomatlarni qo‘sishni tavsiya qiladi. “Tomoq og‘rig‘i, bosh og‘rig‘i va burun oqishi kabi belgilar imkon qadar tezroq ro‘yxatga kiritilishi lozim”.

Buyuk Britaniya to‘rtinchi kuchaytiruvchi dozaning samaradorligini baholadi

Britaniyalik ekspertlarning fikriga ko‘ra, hali to‘rtinchi COVID-19 vaksinasi talab qilinmaydi, chunki kuchaytiruvchi dozalar keksalar orasida “Omicron” variantining og‘ir kasalliklaridan yuqori himoyani ta’minlashda davom etmoqda [10]. Buyuk Britaniya Sog‘liqni saqlash xavfsizligi agentligi ma’lumotlariga ko‘ra, uchinchi inyeksiyani olganidan taxminan uch oy o‘tgach, 65 va undan katta yoshdagi odamlarning kasalxonaga yotqizilishidan himoyalanish taxminan 90% ni tashkil qildi [11].

“Kuzatuv natijalariga ko‘ra, vaksinaning atigi ikki dozasi bilan 65 yoshdan oshgan odamlarni jiddiy kasalliklardan himoya qilish uch oydan keyin taxminan 70 foizga va olti oydan so‘ng 50 foizgacha pasaygan”, - deya ta’kidladi ekspertlar.

“Vaksinaning uchinchi kuchaytiruvchi dozasi keksalarni koronavirusning “Omicron” shtammi keltirib chiqaradigan kasallikning og‘ir oqibatlaridan yuqori darajada himoya qiladi va fikrimcha to‘rtinchi dozaga ehtiyoj yo‘q”, deb ta’kidladi shifokorlar [12].

Johnson & Johnson kompaniyasining ta'kidlashicha, bir doza vaksina 6 oy davomida COVID-19 dan himoya qiladi

Jonson & Jonson kompaniyasining ta'kidlashicha, faqat bitta doza vaksina olti oy davomida koronavirusdan himoya qiladi [13].

Statistik ma'lumotlarga ko'ra, Johnson & Johnson preparati koronavirusga qarshi immunitetni saqlashga yordam beradi, kasalxonaga yotqizish va qayta infeksiyaga chalinishni olti oygacha kamaytiradi. Bundan tashqari, ikkita emas, faqat bitta inyeksiya kerak.

Tadqiqot shuningdek, dori ishlab chiqaruvchi tomonidan moliyalashtirildi. Unda Johnson & Johnson preparati bilan emlangan 168 million odam haqidagi ma'lumotlar tahlil qilindi. Ma'lumotlar 2021-yil 1-yanvardan 7-sentyabrgacha bo'lgan davrda olingan. Shuning uchun tadqiqot "Omicron" shtammini hisobga olmaydi.

Johnson & Johnson kompaniyasi ta'kidlaganidek, vaksinadan keyingi himoya faqat emlashdan keyingi to'rtinchini oydan pasayishni boshlaydi.

Johnson & Johnson kompaniyasining COVID-19 vaksinasida modifikatsiyalangan virusning bir qismi mavjud. Ushbu o'zgartirilgan virus vektor deb ataladi, bu organizmda immunitet reaksiyasini keltirib chiqaradi. Tana immunitet reaksiyasini ishlab chiqargandan so'ng, u hujayralar har qanday keraksiz ma'lumotni o'chirib tashlagani kabi, vaksinaning barcha tarkibiy qismlaridan xalos bo'ladi. Bu jarayon tananing normal faoliyatining bir qismidir. COVID-19 vaksinalarining deyarli barcha tarkibiy qismlari ko'plab oziq-ovqatlar - yog'lar, shakar va tuzlarda ham mavjud [14].
