JSST Pfizer vakinasini 5-11 yoshli bolalarda qo'llashni ma'qulladi

Jahon sog'liqni saqlash tashkiloti (JSST) tomonidan 5-11 yoshli bolalarda qo'llash uchun Pfizer va BioNTech kompaniyalari tomonidan ishlab chiqilgan koronavirus vakinasini tasdiqladi. Bu haqda 21-yanvar kuni Emlash bo'yicha strategik maslahat guruhi (SAGE) o'z veb-saytida ma'lum qildi [5].

Ko'rsatilgan toifadagi shaxslarga preparatning 10 mikrogramga teng dozasini qo'llash tavsiya etiladi, bu 12 yoshdan oshgan insonlarga nisbatan uch baravar kam. Bundan tashqari, SAGE koronavirus infeksiyasi xavfi ostida bo'lgan fuqarolar uchun birinchi ikkita dozadan 4-6 oy o'tgach, COVID-19 ga qarshi qayta emlashni tavsiya qildi [6, 7].

Avvalroq, 21-yanvar kuni Yaponiya Sog'liqni saqlash vazirligi 5 yoshdan 11 yoshgacha bo'lgan bolalarni koronavirusga qarshi emlash uchun Pfizer/BioNTech vakinasidan foydalanishni ma'qullagan edi [8].

Tadqiqotchilar kasallik va emlashdan so'ng Omikron shtammiga qarshi immunitetni o'rganishdi

Omikron varianti SARS-CoV-2 ning oldingi variantlari kasallangan yoki vakcina bilan emlanganda antitanalar reaksiyasidan qisman qochishi mumkin. Biroq, T-hujayralari hali ham omikronni farqlab olmoqda, deb xabar bermoqda Shvetsiyadagi Karolinska instituti olimlari Nature Medicine ilmiy jurnalida chop etilgan tadqiqotda [9].

Omikron tezda SARS-CoV-2 virusining dominant variantiga aylandi. Yangi ma'lumotlarga ko'ra, omikron nafaqat oldingi variantlarga qaraganda yuqumli, balki neytrallashtiruvchi antitanalardan qochib, avvalgi immunitetga ega bo'lgan odamlarga ham yuqishi mumkin. Biroq, emlangan yoki infeksiyalangan insonlarda jiddiy kasallik nisbatan kam uchraydi, bu immunitet tizimining boshqa tarkibiy qismlari hali ham omikronni taniy olishi mumkinligini ko'rsatadi. Karolinska instituti tadqiqotchilari tomonidan olib borilgan yangi tadqiqot natijalariga ko'ra, avvalgi infeksiya yoki mRNA vaksinasidan so'ng hosil bo'lgan xotira T hujayralari ham Omicron variantiga javob beradi.

Shvetsiyadagi Karolinska universiteti kasalxonasi bilan hamkorlikda olib borgan tadqiqotlar emlangan 40 nafar shaxs, yengil yoki og'ir SARS-CoV-2 infeksiyasini o'tkazgan 48 nafar shaxs va ilgari emlanmagan ham kasallikni o'tkazmagan 48 kishidan olingan qon namunalari asoslandi. Emlangan guruhdan olingan namunalar vaksinaning ikkinchi dozasidan olti oy o'tgach va ilgari infeksiyalangan guruhdan — virusning yangi variantlari paydo bo'lishidan oldin 2020 bahorida tasdiqlangan infeksiyadan to'qqiz oy o'tgach to'plangan. Qolgan namunalar 2020-yil oxirida sog'lom donorlardan olingan. Har ikkala eksperimental guruhdagi xotira T-hujayralari omikron boshqoq oqsilini tanib olishning yaxshi qobiliyatini ko'rsatdi; ammo eng yaxshi javob emlangan guruhda kuzatilgan [10].

“ Ushbu natijalar, kuchaytiruvchi immunizatsiya og'ir COVID-19 ning takroriy epizodlaridan himoyani kuchaytirish uchun neytrallashtiruvchi antitanalarni induksiya qilishdan tashqari foyda keltirishi mumkin”, deydi Karolinska instituti yuqumli tibbiyot markazining bosh tadqiqotchi Markus Baggert. Xotira T-hujayralarining omikronga bo'lgan javobi umuman saqlanib qolgan bo'lsada, ba'zi insonlarda ta'siri aniqlanmagan [11].

Braziliya bolalar va o‘smirlarni COVID-19 ga qarshi emlash uchun Xitoyning CoronaVac vaksinasini tasdiqladi

Braziliya Xitoyning CoronaVac vaksinasi bilan 6-17 yoshli bolalar va o‘smirlarni COVID-19 ga qarshi emlashni tasdiqladi. Vakcina Braziliya Milliy sanitariya nazorati agentligi (Anvisa) tomonidan tasdiqlangan. Qarorga ko‘ra, bolalar va o‘smirlar CoronaVac vaksinasining tegishli ikki dozasini 28 kunlik interval bilan olishlari mumkin. Ularda ham kattalardagi singari vaksinalar qo‘llaniladi [12].

Mahalliy OAV ma‘lumotlariga ko‘ra, bunday qaror Anvisa tomonidan COVID-19 ga qarshi vaktsinalarni joriy etish uchun mas‘ul Butantan instituti so‘roviga javoban qabul qilingan. CoronaVac vaksinasi Braziliyada o‘tgan 17-yanvarda 18 va undan katta yoshdagi shaxslar uchun favqulodda foydalanish uchun tasdiqlangan [13].

Rossiya vaksinalar va zardoblar ilmiy instituti COVID-19 ga qarshi “Konvasel” vaksinani ro‘yxatdan o‘tkazish uchun ariza topshirdi

Rossiya Federal Tibbiyot va Biologiya Agentligi (FMBA) huzuridagi Sankt-Peterburg Vaksinalar va zardoblar ilmiy-tadqiqot instituti koronavirusga qarshi “Konvasel” vaksinasini ro‘yxatdan o‘tkazish uchun ariza topshirdi. Bu haqda Rossiya Federatsiyasi Sog‘liqni saqlash vazirligining dori vositalari reestri ma’lumotlaridan olindi [14].

“Savdo nomi: SARS-CoV-2 virusi keltirib chiqaradigan koronavirus infeksiyasining oldini olish uchun Convasel Rekombinant subunit vaksinasi”, – deyiladi xabarda. Preparat mushak ichiga yuborish uchun emulsiya bo‘lib, bitta dozaning hajmi 0,5 ml ni tashkil qiladi. Vaksinaning yaroqlilik muddati 6 oy.

Avvalroq Convasel vaksinasi sinovlar davomida yuqori samaradorlikni namoyish etgani xabar qilingan edi. "Klinik tadqiqot natijalariga ko‘ra, Convasel preparati bilan emlash odamlarda tasdiqlangan immunitetni shakllantiradi, bu koronavirus infeksiyasining rivojlanishiga to‘sqinlik qiladi, N oqsiliga qarshi o‘ziga xos IgG sinfidagi antitanalarning

titrini oshiradi, hujayralar, hamda antitanalarga bog‘liq bo‘lgan sitotoksiklik va hujayra ichidagi virusni zararsizlantiruvchi maxsus faollashtirilgan CD4 + T ning ko‘payishini oldini oladi. Vaksinani olgan ko‘ngillilarning birortasi ham butun kuzatuv davri davomida COVID-19 bilan kasallanmagan”, – deyiladi FMBA matbuot xizmati xabarida.

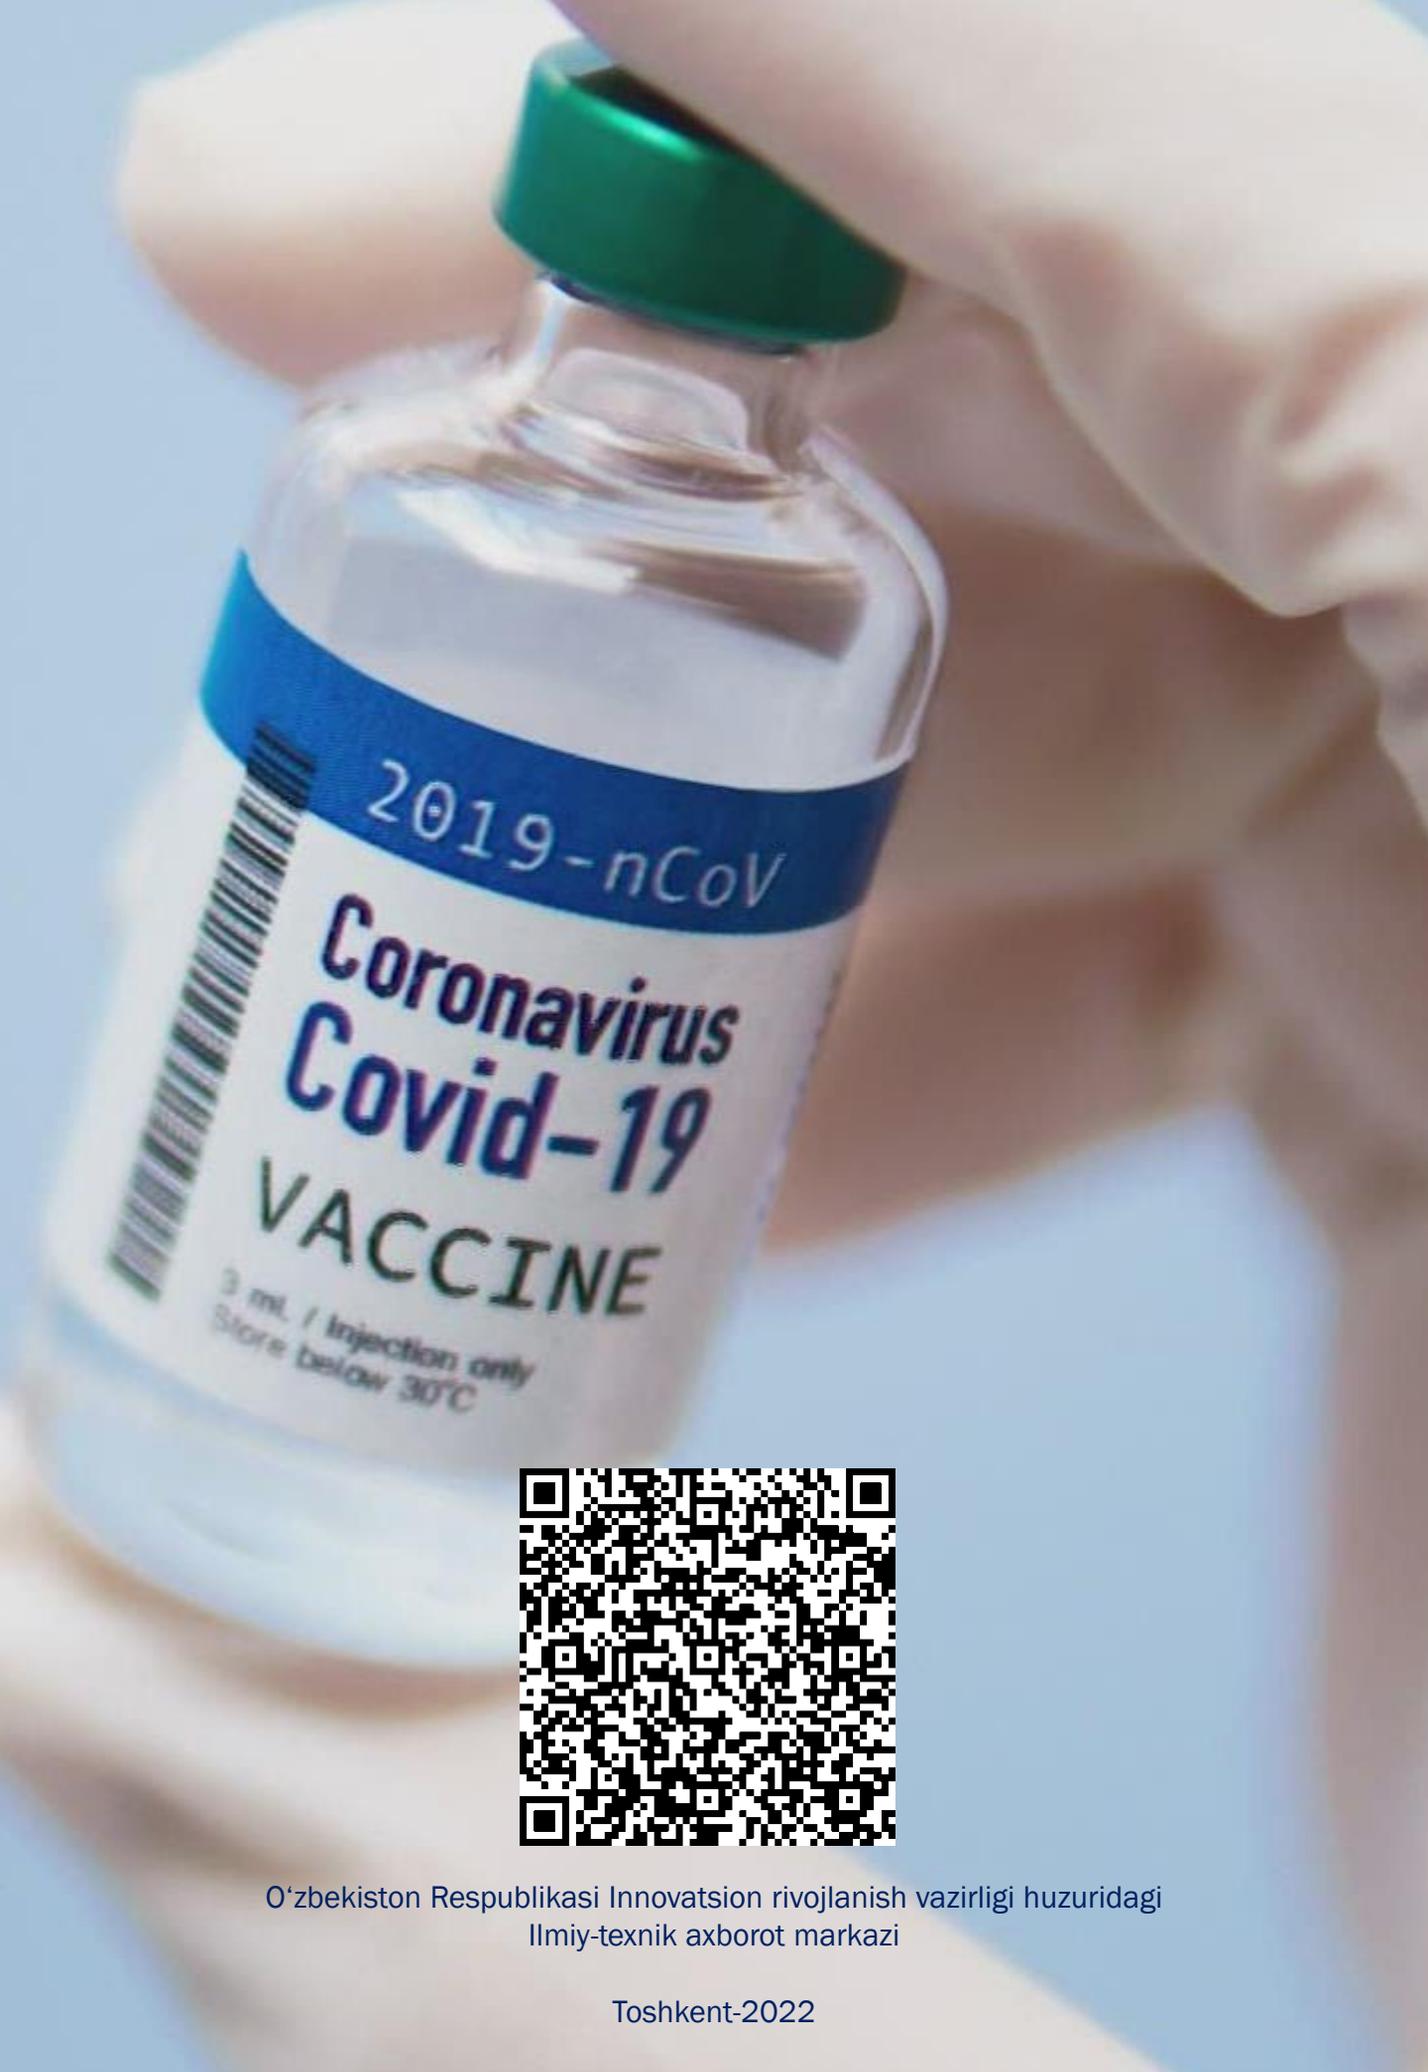

Preparat FMBAning Sankt-Peterburg Vaksinalar va zardoblar ilmiy-tadqiqot instituti negizida 2021-yilda ochilgan rekombinant dori-darmonlar bo‘yicha yangi sexda ishlab chiqarilishi rejalashtirilgan [15].

Eslatib o‘tamiz, Rossiyada allaqachon koronavirusga qarshi oltita vakcina ro‘yxatga olingan: Sputnik V, EpiVacCorona, KoviVac, Sputnik Light, EpiVacCorona-N, shuningdek, o‘smirlar uchun Sputnik M vaksinasi.
