Koronavirusning “Omikron” shtammidan himoyalaniş uchun 41 baravar ko‘proq antitanalar kerak

Vaksina koronavirusning yangi Omikron shtammidan himoya qilish inson organizmida 41 barobar ko‘proq antitana ishlab chiqarishga yordam berishi kerak. Bu haqda Engelxardt nomidagi molekulyar biologiya instituti hujayra ko‘paytirish laboratoriyasi rahbari, professor, Rossiya Fanlar akademiyasining a‘zosi Petr Chumakov ma‘lum qildi [5].

Professorning tushuntirishicha, virus dozasi zararsizlantirish uchun Omikron Uxan shtammidan farqli o‘laroq 41-marta ko‘proq antitelalarni talab qiladi, chunki hali 32 ta mutatsiya bor va ulardan faqat 15 tasi boshhoqsimon antitelolar bilan ta‘sir o‘tkazish sohasida mavjud. Ya‘ni, virusning bu himoya orqali o‘tishi osonroq, ayniqsa, uzoq vaqt davomida emlanganlar uchun va antitanalar darajasi kamaydi, ammo xotira hujayralari hali ham saqlanib qolmoqda, shuning uchun immun tizimi hali ham infeksiyaga qarshi kurasha oladi [6].

Nikolay Kryuchkov, immunolog, “KEG” kontrakt tadqiqot kompaniyasi bosh direktori, f.f.n. so‘zlariga ko‘ra, “Omikron” neytrallashtiruvchi antikorlarning o‘rtacha geometrik titri delta shtammidan to‘rt baravar ko‘proq kerak. Bu kichik farq, demak, og‘ir kursdan bir joyda bir xil yo‘qotish bo‘ladi, lekin bu vaksinalarga bog‘liq. Jiddiylik nuqtai nazaridan samaradorlik 10-15% ga tushishi mumkin-, dedi u [7].

Yekaterinburg markazi “ Vektor” rahbari Aleksandr Semenov ta‘kidlashicha, “Omikron” boshqa shtammlari ko‘ra uch barobar tezroq pnevmoniya olib kelishi mumkin. Agar ilgari infeksiyani yuqtirgan paytdan boshlab 10-11 kun davom etgan bo‘lsa, hozir atigi 3-5 kun davom etmoqda.

Bolalarda koronavirusning “Omikron” shtammining noodatiy alomati aniqlandi

Koronavirusning “Omicron” shtammi bilan kasallangan ba’zi bolalarda teri toshmasi paydo bo’lishi holatlari kuzatilishi mumkin. Bu haqda britaniyalik shifokor Devid Lloyd ma’lum qildi [8].

“Bolalar va kattalardagi “Omikron” shtammi belgilarida boshqa shtamlardan biroz farq bor. Bosh og’rig’i, ishtahani yo’qotish va charchoqqa qo’shimcha ravishda, bolalarda g’ayrioddiy toshma “Omikron” infeksiyasining o’ziga xos xususiyatidir”, dedi shifokor [9].

Lloydning so’zlariga ko’ra, COVID-19 bilan kasallangan katta yoshli bemorlarning faqat kichik guruhida toshmalar uchragan, ammo “Omikron” bilan kasallangan bolalarning 15 foizigacha g’ayrioddiy toshma paydo bo’ladi”.

Yaponiyada COVID-19 zarralari bilan aloqa qilganda nur sochuvchi niqob yaratildi

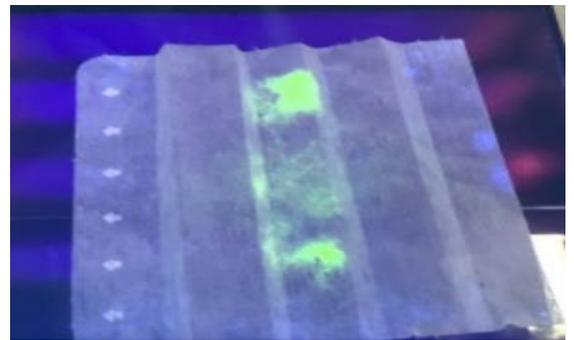

Kioto prefekturasi universiteti olimlari guruhi, agar koronavirus alomatlari bo'lsa, ultrabinafsha nurlar ta'sirida nur sochuvchi niqoblar ishlab chiqdi [10].

Ishlanma muassasa rahbari Yasuxiro Tsukamoto tomonidan boshqargan. Uning jamoasi tomonidan tuyaqushlar organizmi begona jismlarni zararsizlantiruvchi bir necha turdagi antitanalarni ishlab chiqarishga qodir ekanligini aniqladi. Fevral oyida olimlar laboratoriyadagi tuyaqushlar tanasiga COVID-19 ning faolsizlangan zarralarini

yubordilar. Tajriba natijasida mutaxassislar qushlar qo'ygan tuxumlardan ko'p miqdorda antitelalar ajratib olishdi [11].

Jamoa yuz niqobi ichiga joylashgan maxsus filtr ishlab chiqdi. "Filtrni olib tashlash va qo'yilgan tuyaqush tuxumidan koronavirusga antitelalar bo'lgan fluouescent bo'yoq bilan purkash mumkin. Agar virus mavjud bo'lsa, filtr ultrabinafsha spektrda nur sochadi", - deya qo'shimcha qildi Tsukamoto [12].

Yaponiyalik mutaxassislar o'n kun davomida koronavirusga chalingan 32 nafar bemor bilan test o'tkazdi. Ular tadqiqot ishtirokchilari foydalangan niqoblar ultrabinafsha nurlanishiga reaksiyaga kirishishini aniqladilar. Keyinchalik jamoa tajribani 150 a'zoga kengaytirdilar. Tajribalar niqoblarning samaradorligini tasdiqladi. "Kelajakda biz

niqobni har kim foydalanishi mumkin bo'lgan oddiy sinov to'plamiga aylantirmoqchimiz", dedi Tsukamoto.
